${ }^{a}$ For each year below 30 , add $7 \mathrm{kcal} /$ day for women and $10 \mathrm{kcal} / \mathrm{day}$ for men. For each year above 30, subtract 7 $\mathrm{kcal} / \mathrm{day}$ for women and $10 \mathrm{kcal} /$ day for men.
${ }^{b}$ PAL = physical activity level.
${ }^{c} \mathrm{BMI}=$ body mass index.
${ }^{d}$ Derived from the following regression equations based on doubly labeled water data:
Adult man: $\quad \mathrm{EER}=662-9.53 \times$ age $(\mathrm{y})+\mathrm{PA} \times(15.91 \times \mathrm{wt}[\mathrm{kg}]+539.6 \times \mathrm{ht}[\mathrm{m}])$
Adult woman: $\mathrm{EER}=354-6.91 \times$ age $(\mathrm{y})+\mathrm{PA} \times(9.36 \times \mathrm{wt}[\mathrm{kg}]+726 \times \mathrm{ht}[\mathrm{m}])$
Where PA refers to coefficient for PAL

```
PAL = total energy expenditure \div basal energy expenditure
    PA = 1.0 if PAL \geq1.0<1.4 (sedentary)
    PA = 1.12 if PAL \geq1.4<1.6 (low active)
    PA = 1.27 if PAL \geq1.6<1.9 (active)
    PA = 1.45 if PAL \geq1.9<2.5 (very active)
```
